

ComicCraft

Phase 3 – Project Design

1. System Overview

ComicCraft is designed as a simple web-based comic story generation application. Users provide a story idea and related options, and the application presents a comic-style result.

2. System Architecture

- User Interface: collects story prompt, character, setting, tone and art-style details.
- Application Logic: processes the entered information and prepares the comic story output.
- Output Layer: displays the generated story in a clear comic-oriented format.

3. User Interface Design

- Simple and clean input form.
- Clearly labelled fields and selection options.
- Generate Comic button for starting the process.
- Readable output area for the generated result.

4. Input Design

- Story prompt or idea.
- Character details.
- Setting details.
- Tone selection.
- Art-style selection.

5. Output Design

- Generated comic story content.
- Structured and readable presentation.
- Clear separation of story information and comic output.

6. Technology Design

- Frontend technologies such as HTML, CSS and JavaScript.
- Python may be used for supporting application logic where required.
- Web browser used to access the application.

7. Expected Result

The design provides a clear structure for developing ComicCraft and ensures that user inputs can be converted into an understandable comic-style output.
