

ComicCraft

Phase 5 – Project Development

1. Development Overview

The ComicCraft application is developed as a web-based project with a user interface for entering comic story requirements and viewing the generated result.

2. Frontend Development

- Created the main web page using HTML.
- Added user input fields for story-related information.
- Designed a simple and user-friendly layout.
- Added controls for generating and displaying the comic output.

3. Application Logic

- Process the user's entered story idea and selected options.
- Prepare the required comic story content.
- Display the generated content to the user.

4. Project Files

- index.html – main web interface.
- main.py – Python application/supporting logic where required.
- README.md – project information and usage details.

5. Deployment

The web application was published as a live web project so that users can access the ComicCraft interface through a browser.

6. Development Testing

- Run the application in a browser.
- Enter sample story information.
- Check that the generation control responds correctly.
- Verify that the generated result is displayed properly.

7. Expected Result

A functional ComicCraft web application with an accessible interface for creating and presenting comic-style stories.
